Phishing vs. legitimate email

Synthetic case comparison | 05 November 2026 | CONFIDENTIAL

Account security phishing

100 /100 CRITICAL

10 risk findings | 16 extracted indicators

Legitimate business email

0 /100 LOW

0 risk findings | 6 extracted indicators

COMPARE	PHISHING SIMULATION	LEGITIMATE CONTROL
Message context	Claims "Microsoft Security" from **verify-account.example**. Urgent account-verification request.	Taylor Morgan at **company.example**. Routine project-planning meeting.
Key findings	**F001-F002:** Different Reply-To domain; brand impersonation indicator. **F006-F007:** Urgency and credential request. **F008-F010:** Disguised destination, hidden link, and embedded redirect target.	No configured local risk factors detected. No Reply-To supplied; no credential lure, urgency trigger, URL, or attachment detected.
SPF (reported)	**FAIL**	**PASS**
DKIM (reported)	**FAIL**	**PASS**
DMARC (reported)	**FAIL**	**PASS**
Indicator footprint	16 extracted values, including **4 URLs**. No attachments. Reputation unverified.	6 extracted values; **0 URLs**. No attachments. Extraction is not a threat verdict.
ATT&CK mapping	**T1566** - Phishing **T1566.002** - Spearphishing Link Initial Access; suspected; medium confidence.	No evidence-supported mappings. Phishing and execution are not established.
Assessment limits	Local assessment confidence: **medium**. No evidence of successful compromise.	Local assessment confidence: **low**. A 0 score does not guarantee safety.

Interpretation: Corroborating identity, social-engineering and link anomalies distinguish the phishing sample from the routine business email. Neither record establishes a click, execution, credential exposure or breach.

Evidence caveat: Authentication results are supplied-header claims; gateway provenance is unverified. No external intelligence was queried. Scores are local heuristics with application-defined thresholds, not an externally verified safety verdict.
